Introduction

INTRODUCTION

The Advanced Encryption Standard (AES) is a symmetric-key block cipher published by the National Institute of Standards and Technology (NIST) in December 2001.

Topics discussed in this section:

1. [History](#)
2. [Criteria](#)
3. [Rounds](#)
4. [Data Units](#)
5. [Structure of Each Round](#)

History

In February 2001, NIST announced that a draft of the Federal Information Processing Standard (FIPS) was available for public review and comment. Finally, AES was published as FIPS 197 in the Federal Register in December 2001.

Criteria

The criteria defined by NIST for selecting AES fall into three areas:

- 1. Security*
- 2. Cost*
- 3. Implementation.*

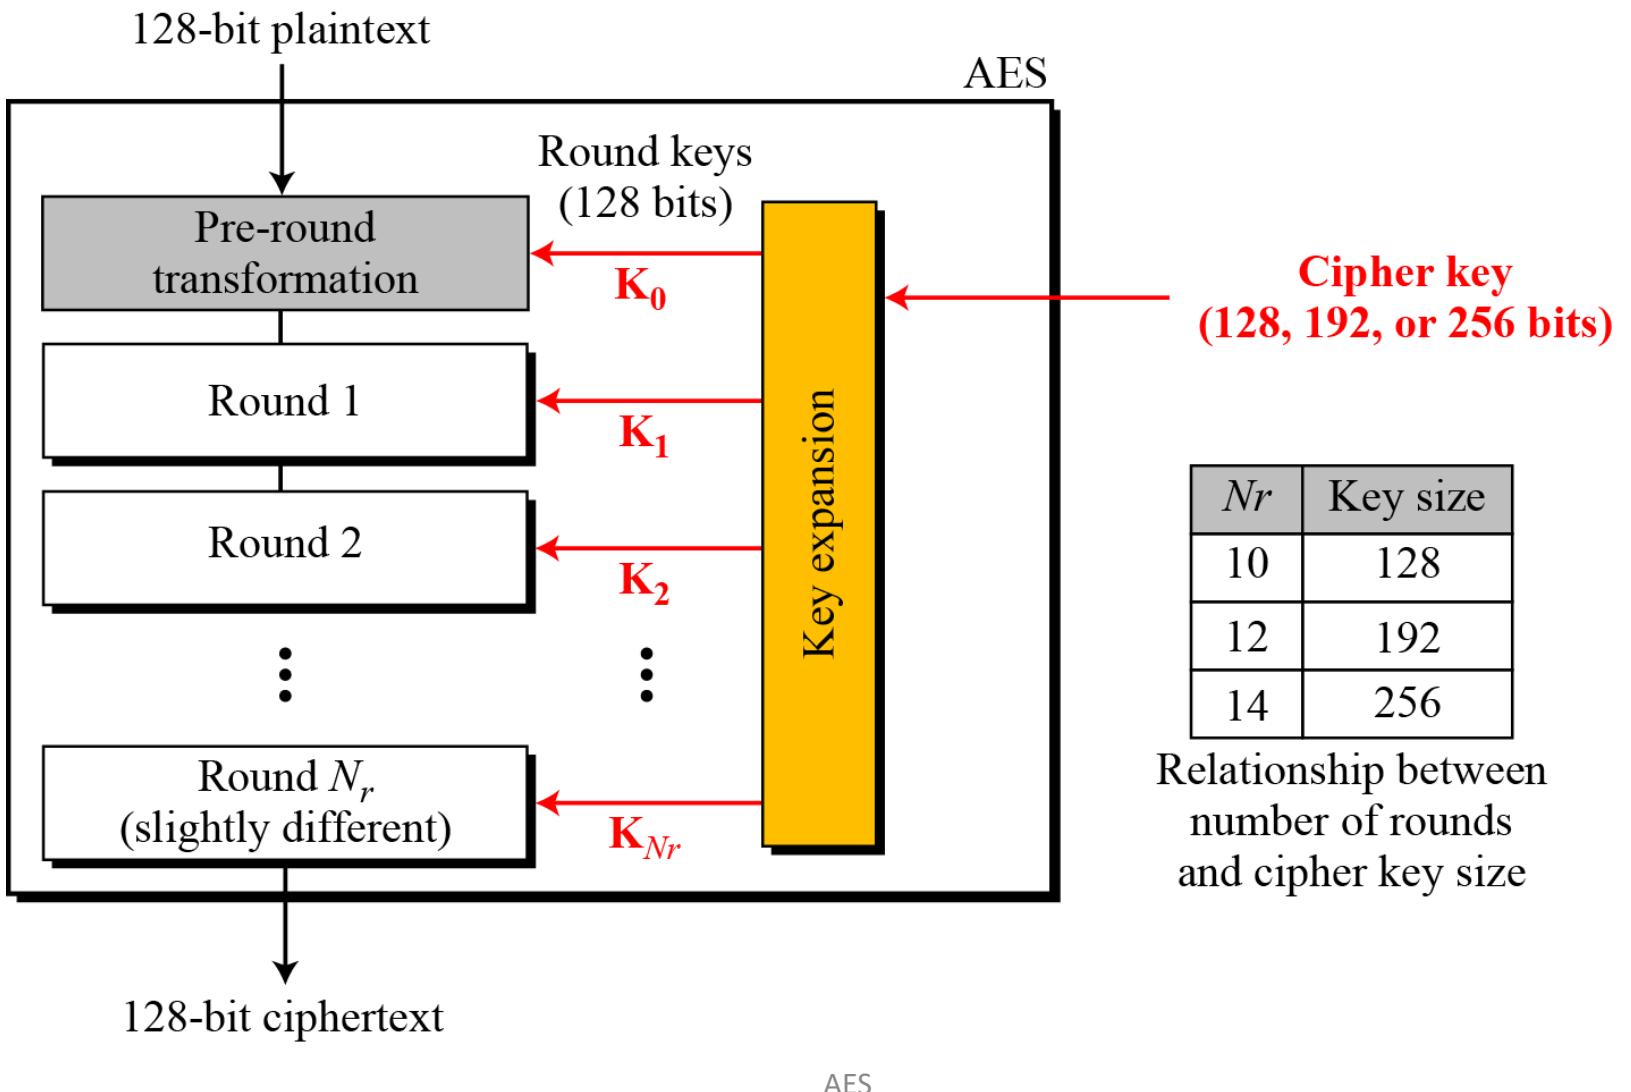

Round

AES is a non-Feistel cipher that encrypts and decrypts a data block of 128 bits. It uses 10, 12, or 14 rounds. The key size, which can be 128, 192, or 256 bits, depends on the number of rounds.

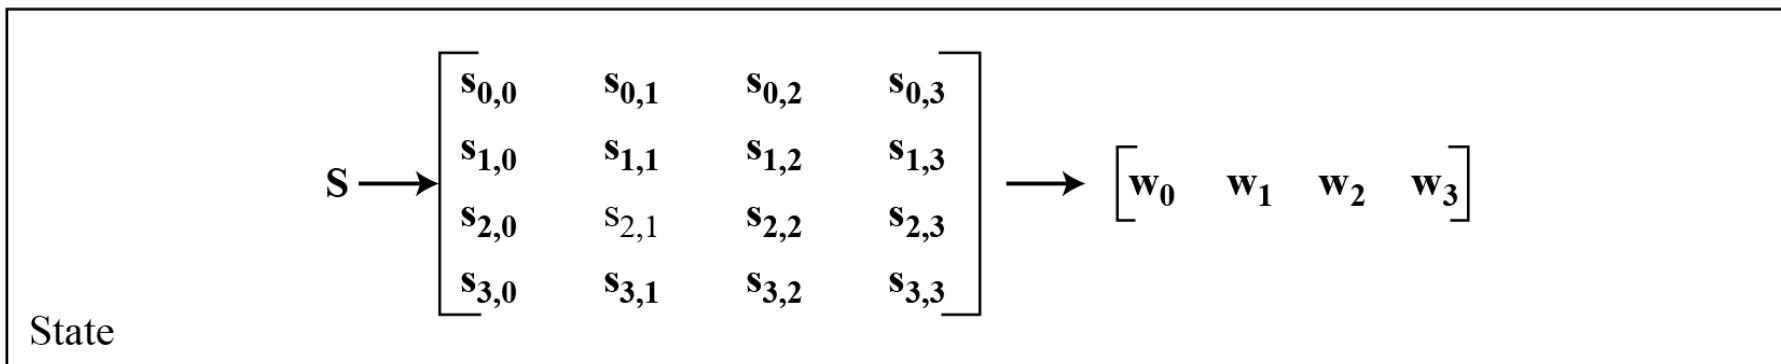

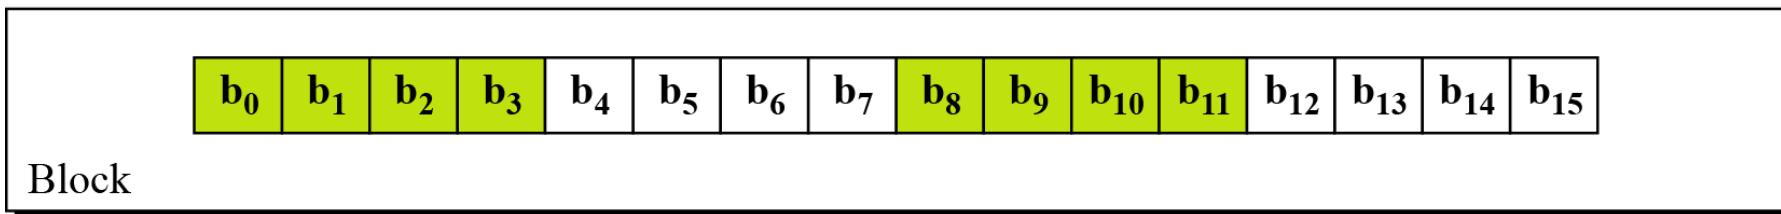

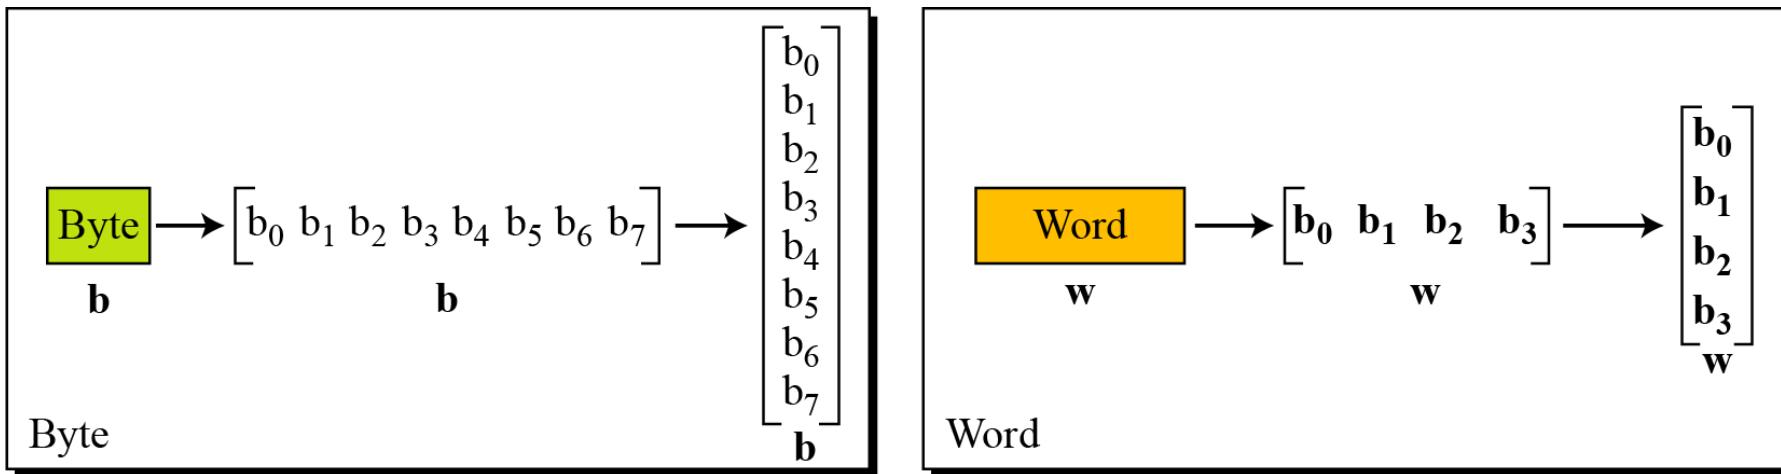

AES has defined three versions, with 10, 12, and 14 rounds.

Each version uses a different cipher key size (128, 192, or 256), but the round keys are always 128 bits.

General Design

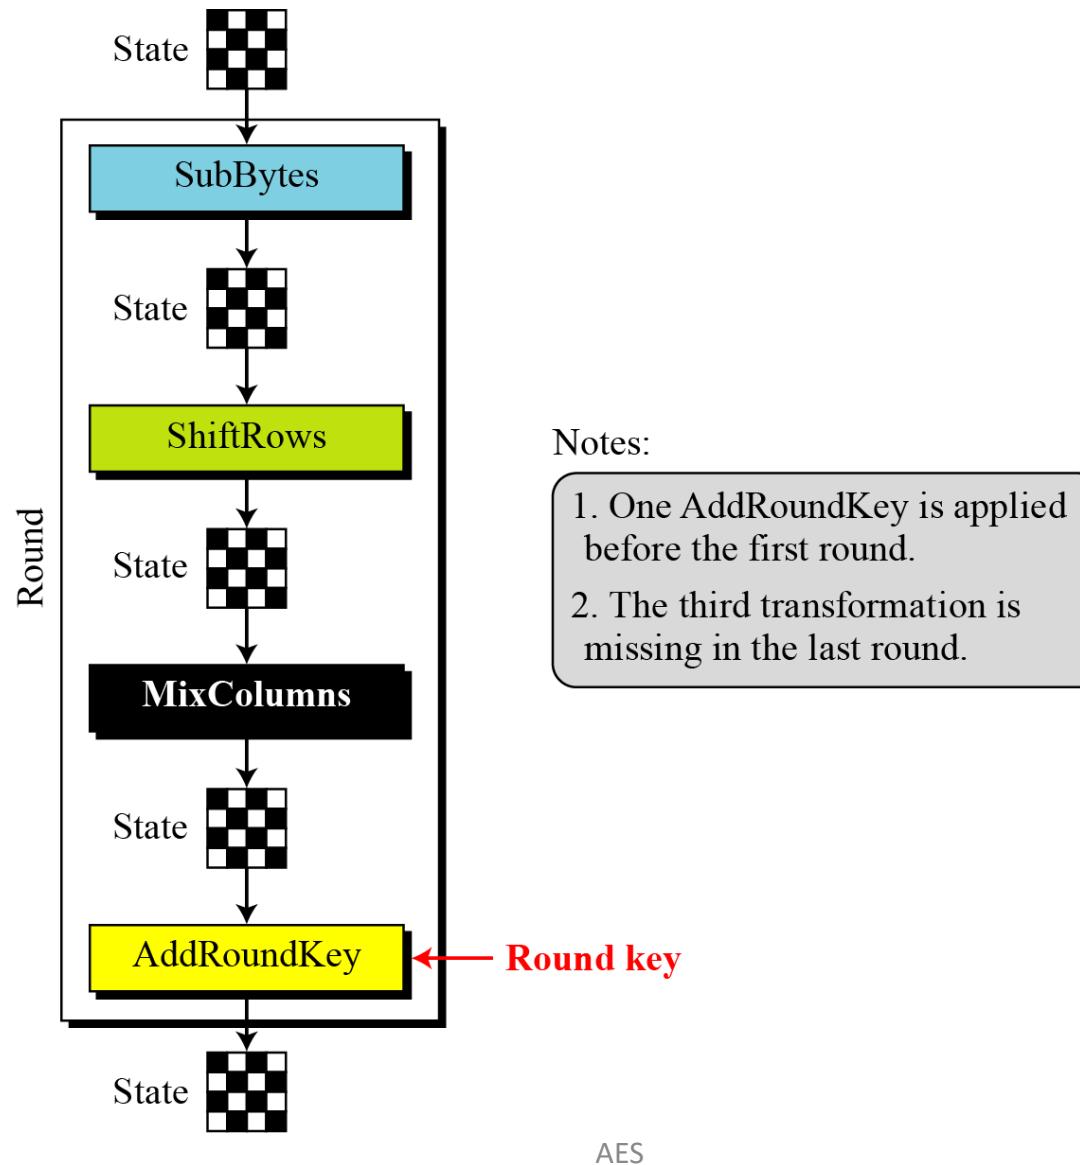

Data Units

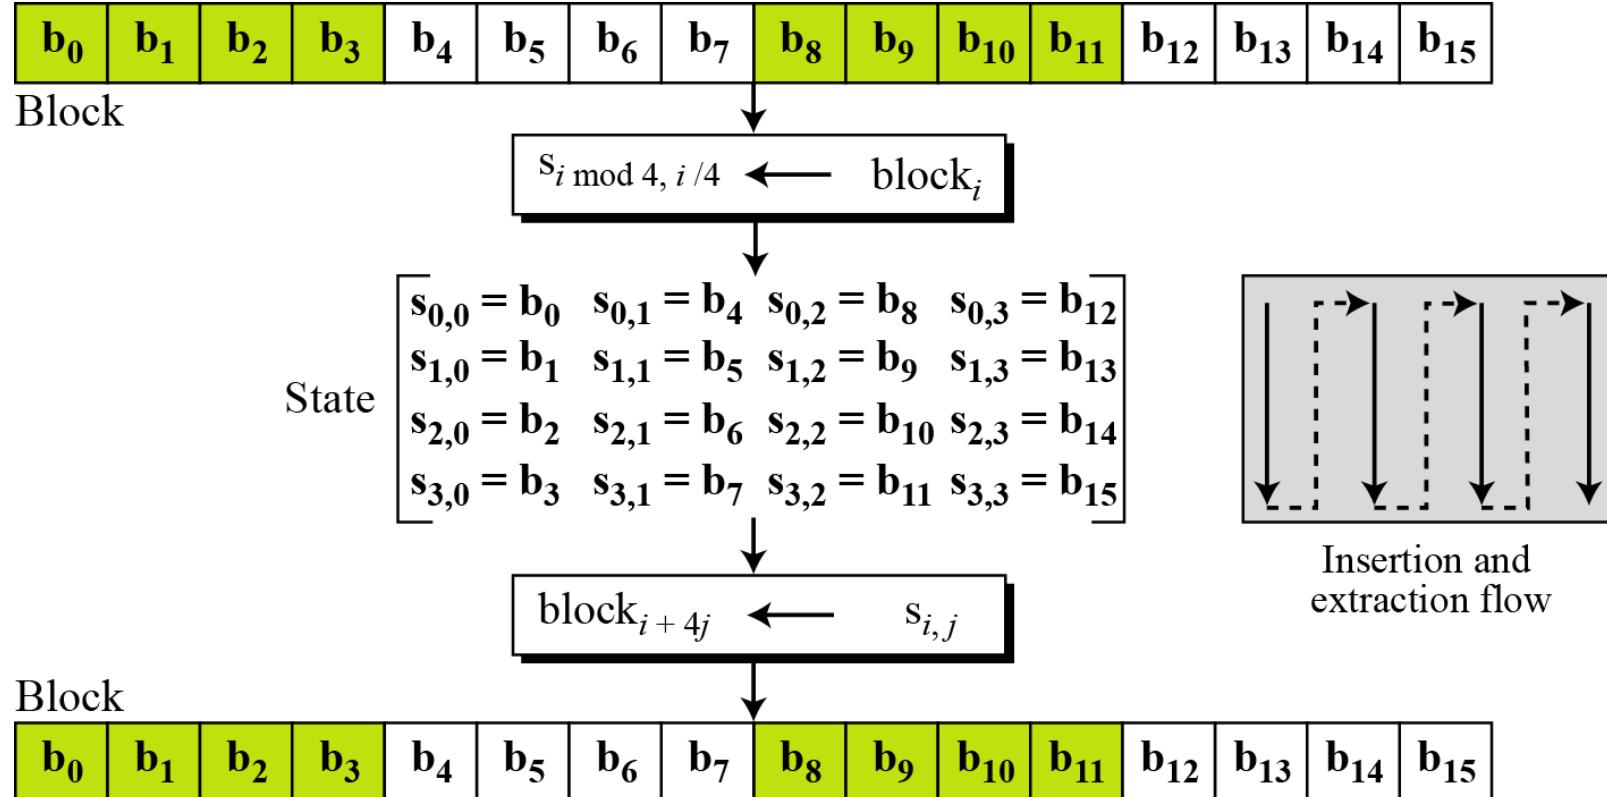

Changing plaintext to state

Text	A	E	S	U	S	E	S	A	M	A	T	R	I	X	Z	Z
Hexadecimal	00	04	12	14	12	04	12	00	0C	00	13	11	08	23	19	19
$\begin{bmatrix} 00 & 12 & 0C & 08 \\ 04 & 04 & 00 & 23 \\ 12 & 12 & 13 & 19 \\ 14 & 00 & 11 & 19 \end{bmatrix} \text{ State}$																

Structure of each round at the encryption site

Block-to-state and state-to-block transformation

2

Transformations

Transformations

To provide security, AES uses four types of transformations: substitution, permutation, mixing, and key-adding.

Topics discussed in this section:

1. Substitution
2. Permutation
3. Mixing
4. Key Adding

Substitution

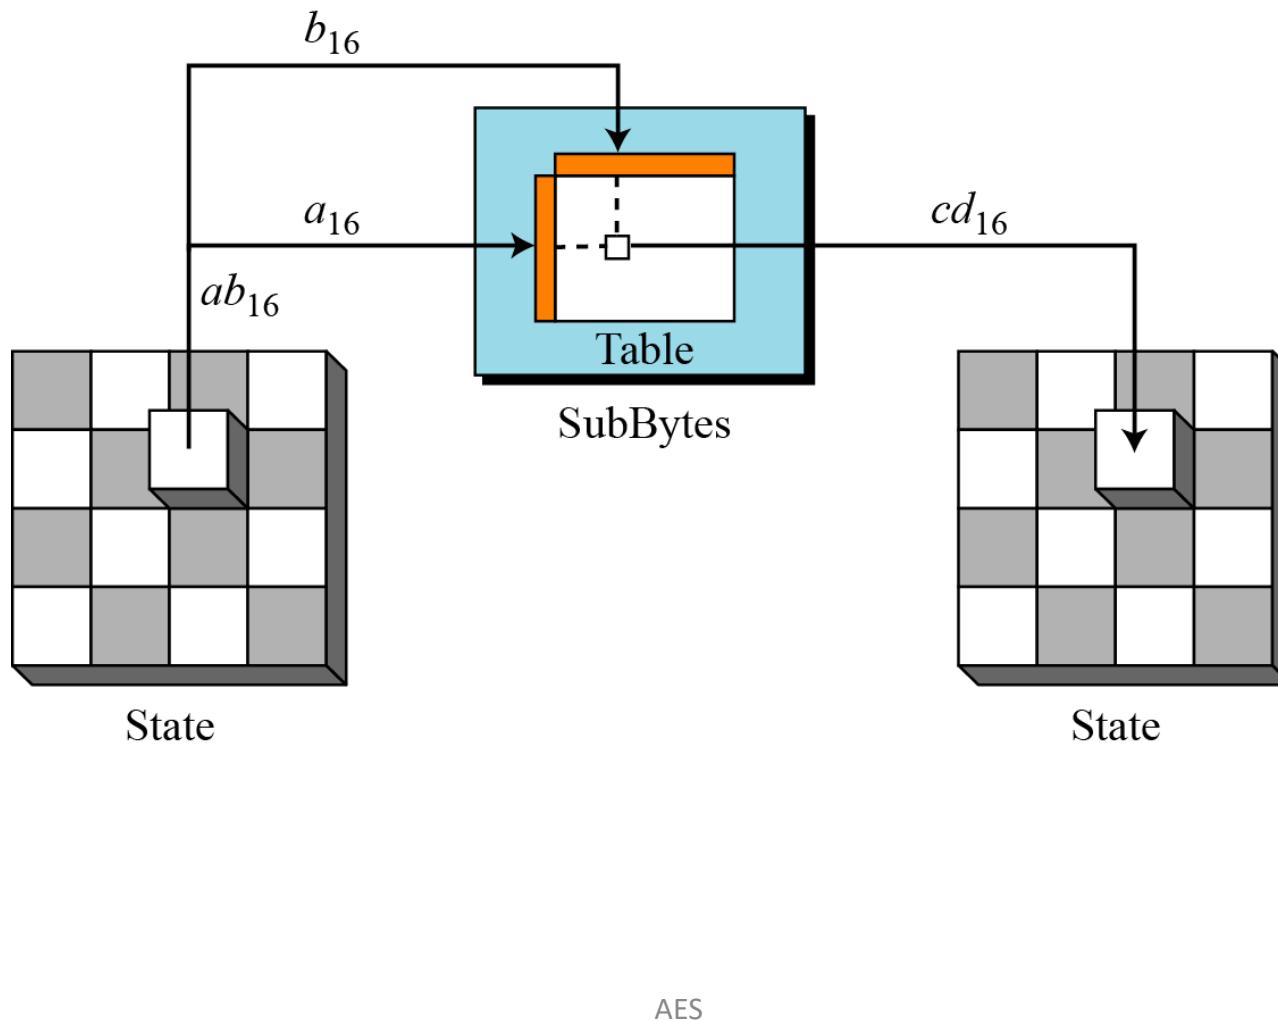

AES, like DES, uses substitution. AES uses two invertible transformations.

SubBytes

The first transformation, SubBytes, is used at the encryption site. To substitute a byte, we interpret the byte as two hexadecimal digits.

The SubBytes operation involves 16 independent byte-to-byte transformations.

SubBytes transformation

SubBytes transformation for Example

The figure shows how a state is transformed using the SubBytes transformation. The figure also shows that the InvSubBytes transformation creates the original one. Note that if the two bytes have the same values, their transformation is also the same.

Transformation Using the GF(2⁸) Field

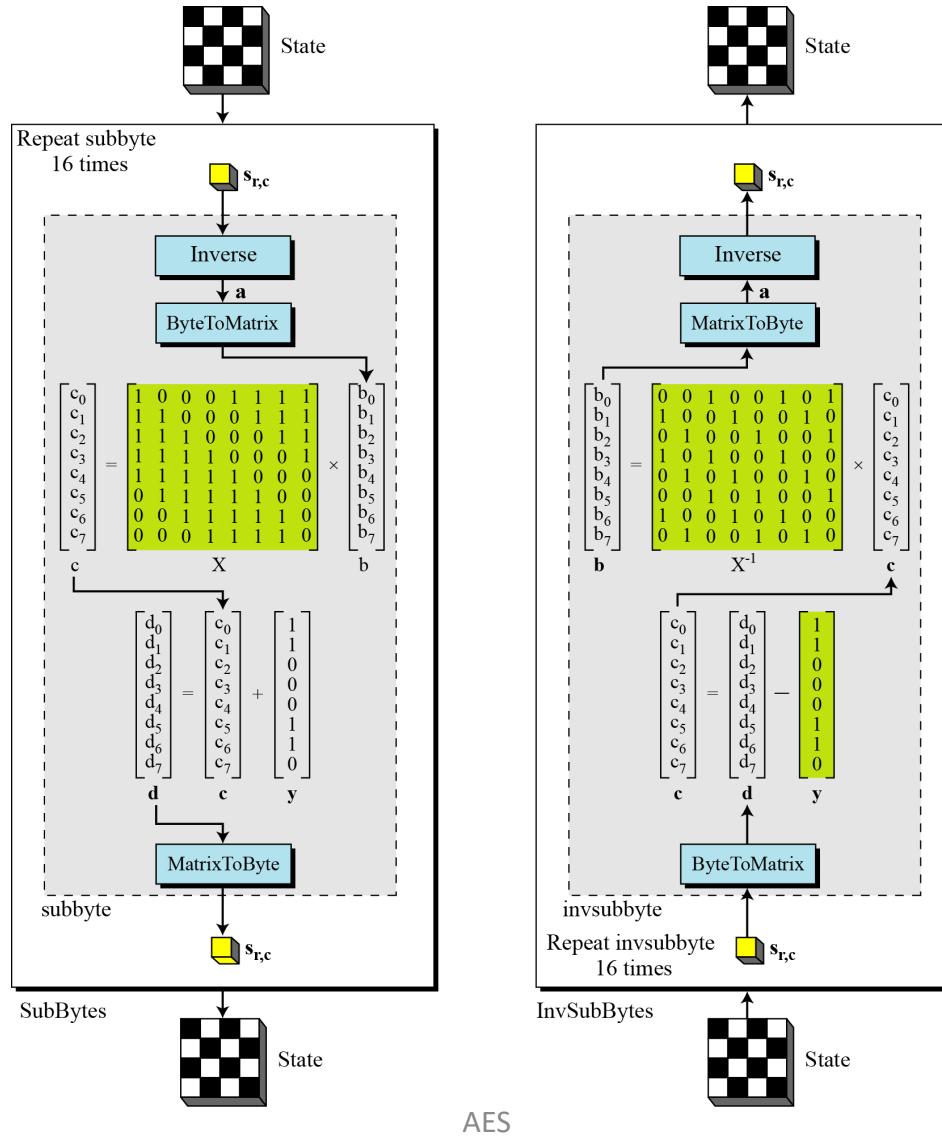

AES also defines the transformation algebraically using the GF(2⁸) field with the irreducible polynomials (x⁸ + x⁴ + x³+ x + 1), as shown in Figure 7.8.

$$\text{subbyte: } \rightarrow \mathbf{d} = \mathbf{X} (s_{r,c})^{-1} \oplus \mathbf{y}$$

$$\text{invsubbyte: } \rightarrow [\mathbf{X}^{-1}(\mathbf{d} \oplus \mathbf{y})]^{-1} = [\mathbf{X}^{-1}(\mathbf{X} (s_{r,c})^{-1} \oplus \mathbf{y} \oplus \mathbf{y})]^{-1} = [(s_{r,c})^{-1}]^{-1} = s_{r,c}$$

The SubBytes and InvSubBytes transformations are inverses of each other.

SubBytes and InvSubBytes processes

Transformation Example

Let us show how the byte 0C is transformed to FE by subbyte routine and transformed back to 0C by the invsubbyte routine.

1. *subbyte*:

- a. The multiplicative inverse of 0C in GF(2^8) field is B0, which means **b** is (10110000).
- b. Multiplying matrix **X** by this matrix results in **c** = (10011101)
- c. The result of XOR operation is **d** = (11111110), which is FE in hexadecimal.

2. *invsubbyte*:

- a. The result of XOR operation is **c** = (10011101)
- b. The result of multiplying by matrix **X⁻¹** is (11010000) or B0
- c. The multiplicative inverse of B0 is 0C.

Pseudocode for Subbyte Transformation

SubBytes (\mathbf{S})

```
{  
    for (r = 0 to 3)  
        for (c = 0 to 3)  
             $S_{r,c} = \text{subbyte}(S_{r,c})$   
}
```

subbyte (byte)

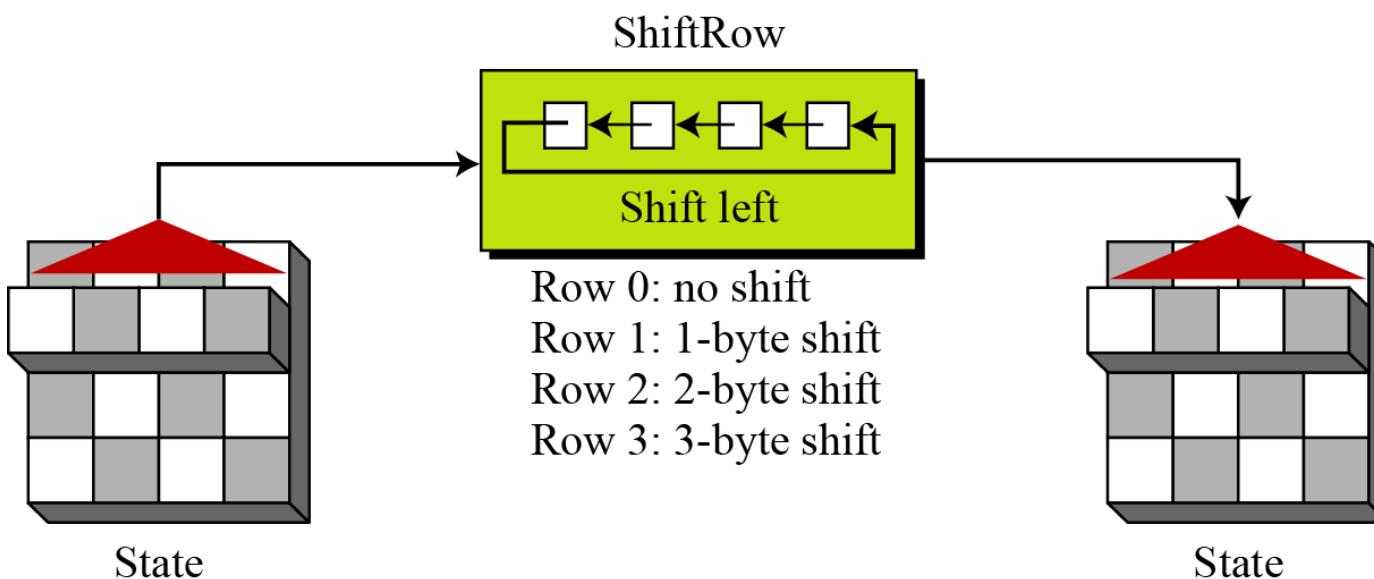

```
{  
    a  $\leftarrow$  byte $^{-1}$           //Multiplicative inverse in  $GF(2^8)$  with inverse of 00 to be 00  
    ByteToMatrix (a,  $\mathbf{b}$ )  
    for (i = 0 to 7)  
    {  
         $\mathbf{c}_i \leftarrow \mathbf{b}_i \oplus \mathbf{b}_{(i+4)\bmod 8} \oplus \mathbf{b}_{(i+5)\bmod 8} \oplus \mathbf{b}_{(i+6)\bmod 8} \oplus \mathbf{b}_{(i+7)\bmod 8}$   
         $\mathbf{d}_i \leftarrow \mathbf{c}_i \oplus \text{ByteToMatrix}(0x63)$   
    }  
    MatrixToByte ( $\mathbf{d}$ , d)  
    byte  $\leftarrow$  d  
}
```

Permutation

Another transformation found in a round is shifting, which permutes the bytes.

ShiftRows

In the encryption, the transformation is called ShiftRows.

InvShiftRows

In the decryption, the transformation is called InvShiftRows and the shifting is to the right.

Algorithm 7.2 Pseudocode for ShiftRows transformation

ShiftRows (\mathbf{S})

{

for ($r = 1$ to 3)

 shiftrow (\mathbf{s}_r, r) // s_r is the r th row

}

shiftrow (\mathbf{row}, n)

// n is the number of bytes to be shifted

{

 CopyRow (\mathbf{row}, \mathbf{t})

// t is a temporary row

 for ($c = 0$ to 3)

$\mathbf{row}_{(c - n) \bmod 4} \leftarrow \mathbf{t}_c$

}

Shift Rows and Inv Shift Rows Transformation

Figure shows how a state is transformed using ShiftRows transformation. The figure also shows that InvShiftRows transformation creates the original state.

Mixing

We need an interbyte transformation that changes the bits inside a byte, based on the bits inside the neighboring bytes. We need to mix bytes to provide diffusion at the bit level.

$$\begin{array}{l} ax + by + cz + dt \\ ex + fy + gz + ht \\ ix + jy + kz + lt \\ mx + ny + oz + pt \end{array} \xrightarrow{\text{New matrix}} = \begin{bmatrix} a & b & c & d \\ e & f & g & h \\ i & j & k & l \\ m & n & o & p \end{bmatrix} \times \begin{bmatrix} x \\ y \\ z \\ t \end{bmatrix}$$

Constant matrix

Old matrix

Constant matrices used by MixColumns and InvMixColumns

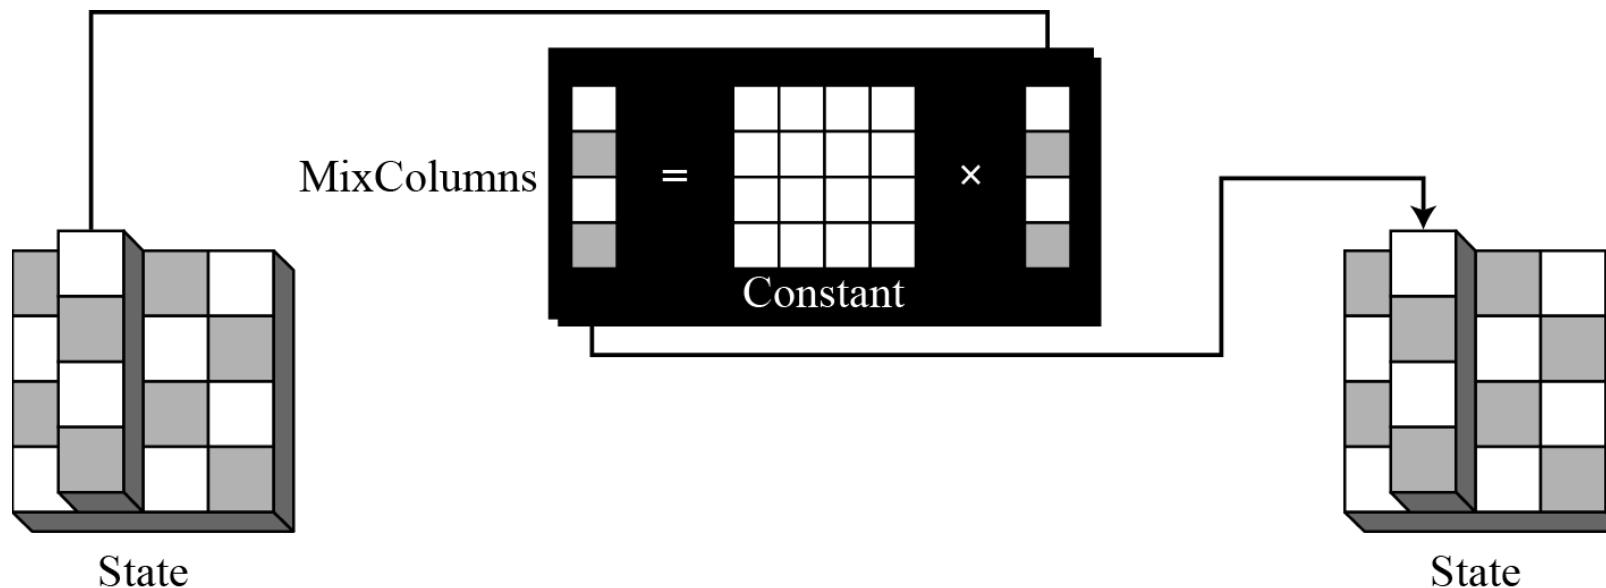

$$\begin{bmatrix} 02 & 03 & 01 & 01 \\ 01 & 02 & 03 & 01 \\ 01 & 01 & 02 & 03 \\ 03 & 01 & 01 & 02 \end{bmatrix} \xleftrightarrow{\text{Inverse}} \begin{bmatrix} 0E & 0B & 0D & 09 \\ 09 & 0E & 0B & 0D \\ 0D & 09 & 0E & 0B \\ 0B & 0D & 09 & 0E \end{bmatrix}$$

C C^{-1}

MixColumns transformation

MixColumns

The MixColumns transformation operates at the column level; it transforms each column of the state to a new column.

InvMixColumns

InvMixColumns

The InvMixColumns transformation is basically the same as the MixColumns transformation.

The MixColumns and InvMixColumns transformations are inverses of each other.

Pseudocode for Mixcolumn Transformation

```
MixColumns ( $S$ )
{
    for ( $c = 0$  to  $3$ )
        mixcolumn ( $s_c$ )
}

mixcolumn (col)
{
    .
    CopyColumn ( $col, t$ )          // t is a temporary column

     $col_0 \leftarrow (0x02) \bullet t_0 \oplus (0x03 \bullet t_1) \oplus t_2 \oplus t_3$ 

     $col_1 \leftarrow t_0 \oplus (0x02) \bullet t_1 \oplus (0x03) \bullet t_2 \oplus t_3$ 

     $col_2 \leftarrow t_0 \oplus t_1 \oplus (0x02) \bullet t_2 \oplus (0x03) \bullet t_3$ 

     $col_3 \leftarrow (0x03 \bullet t_0) \oplus t_1 \oplus t_2 \oplus (0x02) \bullet t_3$ 
}
```

The MixColumns transformation

The figure shows how a state is transformed using the MixColumns transformation. The figure also shows that the InvMixColumns transformation creates the original one.

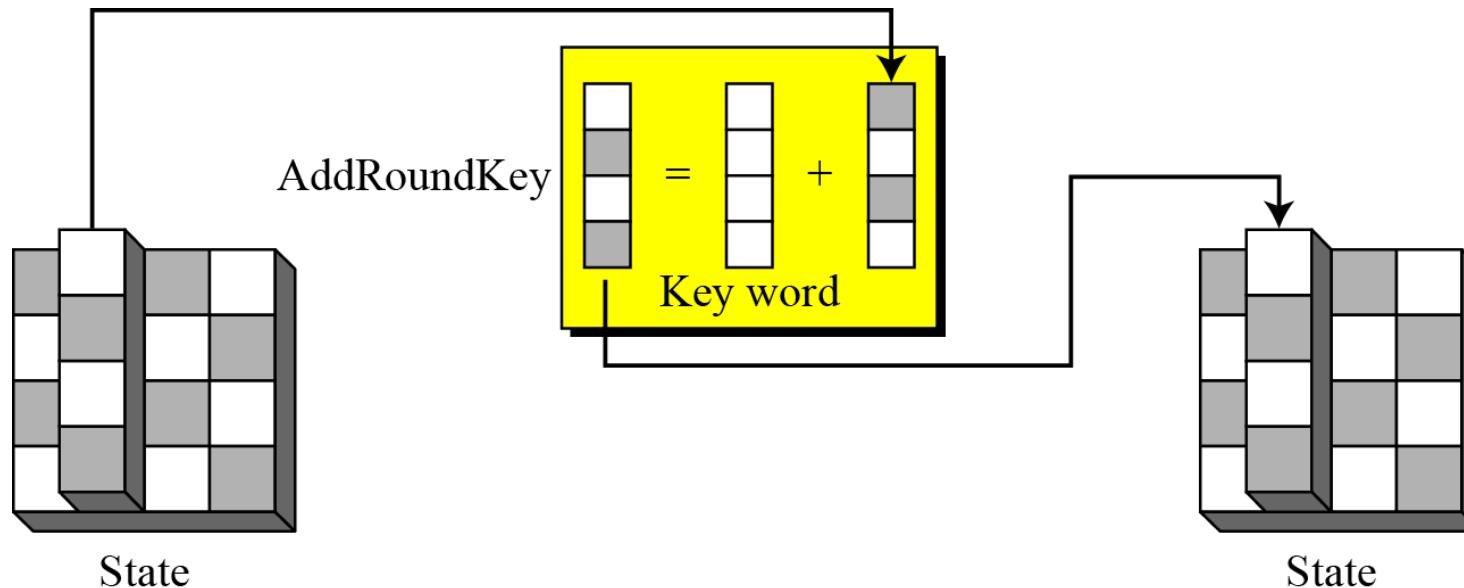

Key Adding

AddRoundKey

AddRoundKey proceeds one column at a time. AddRoundKey adds a round key word with each state column matrix; the operation in AddRoundKey is matrix addition.

The AddRoundKey transformation is the inverse of itself.

Addround key Transformation

Algorithm 7.4 Pseudocode for AddRoundKey transformation

```
AddRoundKey (S)
{
    for ( $c = 0$  to  $3$ )
         $s_c \leftarrow s_c \oplus w_{\text{round} + 4c}$ 
}
```

3

Key Expansion

KEY EXPANSION

To create round keys for each round, AES uses a key-expansion process. If the number of rounds is N_r , the key-expansion routine creates $N_r + 1$ 128-bit round keys from one single 128-bit cipher key.

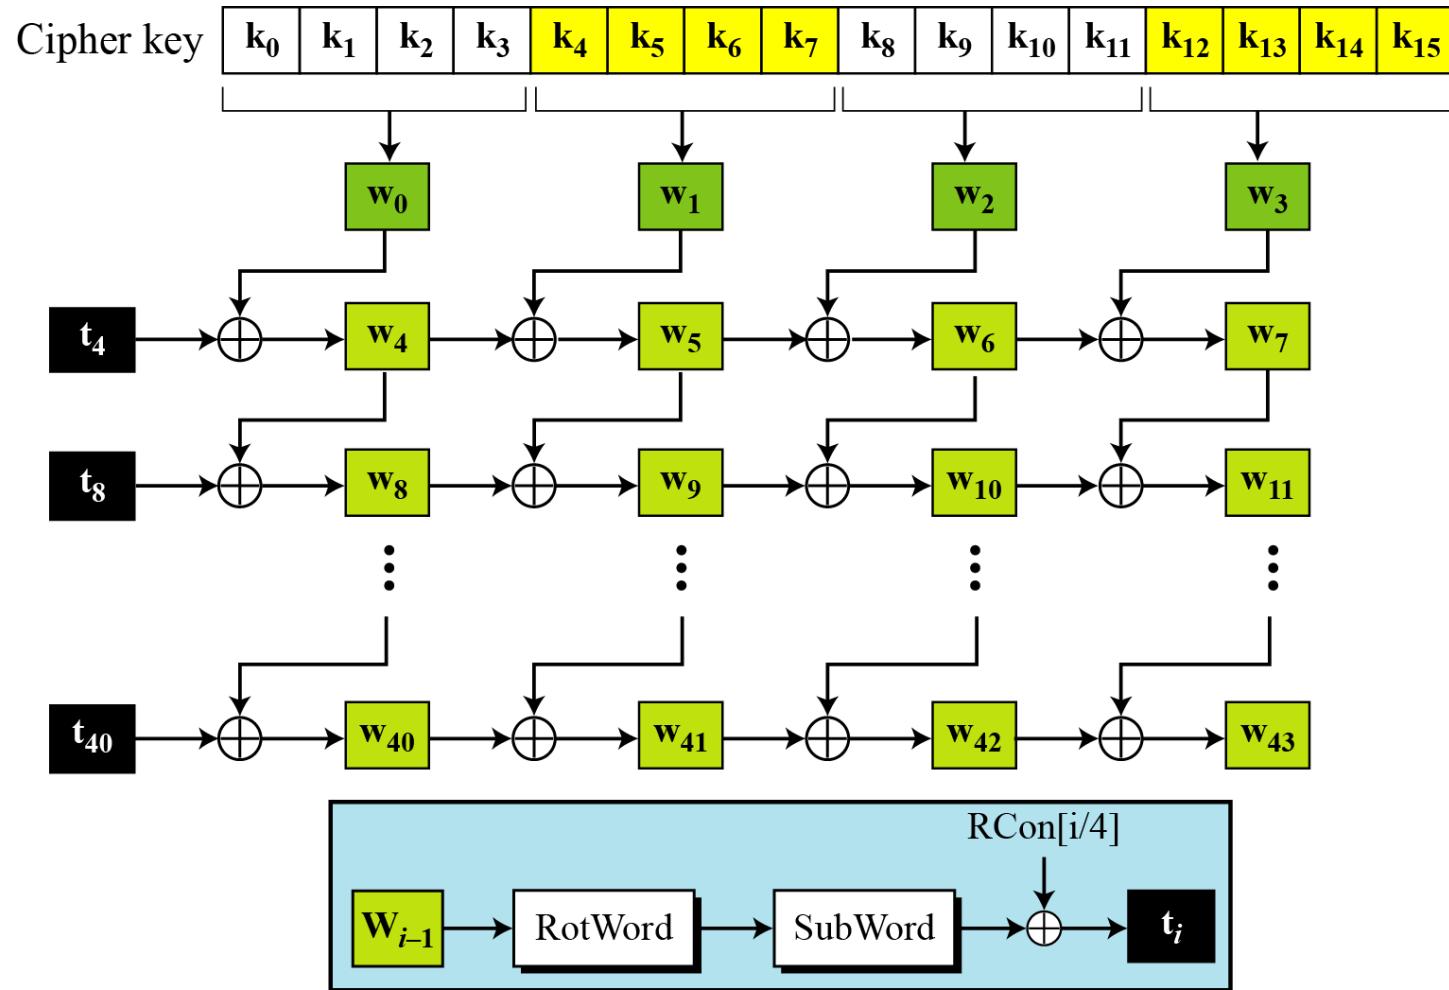

Topics discussed in this section:

1. Key Expansion in AES-128
2. Key Expansion in AES-192 and AES-256
3. Key-Expansion Analysis

Key in Each Round

<i>Round</i>	<i>Words</i>			
Pre-round	\mathbf{w}_0	\mathbf{w}_1	\mathbf{w}_2	\mathbf{w}_3
1	\mathbf{w}_4	\mathbf{w}_5	\mathbf{w}_6	\mathbf{w}_7
2	\mathbf{w}_8	\mathbf{w}_9	\mathbf{w}_{10}	\mathbf{w}_{11}
...	...			
N_r	\mathbf{w}_{4N_r}	\mathbf{w}_{4N_r+1}	\mathbf{w}_{4N_r+2}	\mathbf{w}_{4N_r+3}

Key Expansion in AES-128

Rcon Constants

<i>Round</i>	<i>Constant (RCon)</i>	<i>Round</i>	<i>Constant (RCon)</i>
1	$(\underline{01} \text{ } 00 \text{ } 00 \text{ } 00)_{16}$	6	$(\underline{20} \text{ } 00 \text{ } 00 \text{ } 00)_{16}$
2	$(\underline{02} \text{ } 00 \text{ } 00 \text{ } 00)_{16}$	7	$(\underline{40} \text{ } 00 \text{ } 00 \text{ } 00)_{16}$
3	$(\underline{04} \text{ } 00 \text{ } 00 \text{ } 00)_{16}$	8	$(\underline{80} \text{ } 00 \text{ } 00 \text{ } 00)_{16}$
4	$(\underline{08} \text{ } 00 \text{ } 00 \text{ } 00)_{16}$	9	$(\underline{1B} \text{ } 00 \text{ } 00 \text{ } 00)_{16}$
5	$(\underline{10} \text{ } 00 \text{ } 00 \text{ } 00)_{16}$	10	$(\underline{36} \text{ } 00 \text{ } 00 \text{ } 00)_{16}$

Key Expansion using GF(2⁸) field

The key-expansion routine can either use the above table when calculating the words or use the GF(2⁸) field to calculate the leftmost byte dynamically, as shown below (prime is the irreducible polynomial):

RC ₁	$\rightarrow x^{1-1}$	$=x^0$	mod prime	$= 1$	$\rightarrow 00000001$	$\rightarrow 01_{16}$
RC ₂	$\rightarrow x^{2-1}$	$=x^1$	mod prime	$= x$	$\rightarrow 00000010$	$\rightarrow 02_{16}$
RC ₃	$\rightarrow x^{3-1}$	$=x^2$	mod prime	$= x^2$	$\rightarrow 00000100$	$\rightarrow 04_{16}$
RC ₄	$\rightarrow x^{4-1}$	$=x^3$	mod prime	$= x^3$	$\rightarrow 00001000$	$\rightarrow 08_{16}$
RC ₅	$\rightarrow x^{5-1}$	$=x^4$	mod prime	$= x^4$	$\rightarrow 00010000$	$\rightarrow 10_{16}$
RC ₆	$\rightarrow x^{6-1}$	$=x^5$	mod prime	$= x^5$	$\rightarrow 00100000$	$\rightarrow 20_{16}$
RC ₇	$\rightarrow x^{7-1}$	$=x^6$	mod prime	$= x^6$	$\rightarrow 01000000$	$\rightarrow 40_{16}$
RC ₈	$\rightarrow x^{8-1}$	$=x^7$	mod prime	$= x^7$	$\rightarrow 10000000$	$\rightarrow 80_{16}$
RC ₉	$\rightarrow x^{9-1}$	$=x^8$	mod prime	$= x^4 + x^3 + x + 1$	$\rightarrow 00011011$	$\rightarrow 1B_{16}$
RC ₁₀	$\rightarrow x^{10-1}$	$=x^9$	mod prime	$= x^5 + x^4 + x^2 + x$	$\rightarrow 00110110$	$\rightarrow 36_{16}$

Pseucode for Keyexpansion in AES 128

```
KeyExpansion ([key0 to key15], [w0 to w43])
{
    for (i = 0 to 3)
        wi ← key4i + key4i+1 + key4i+2 + key4i+3

    for (i = 4 to 43)
    {
        if (i mod 4 ≠ 0)    wi ← wi-1 + wi-4
        else
        {
            t ← SubWord (RotWord (wi-1)) ⊕ RConi/4      //t is a temporary word
            wi ← t + wi-4
        }
    }
}
```

Example

Table 7.5 shows how the keys for each round are calculated assuming that the 128-bit cipher key agreed upon by Alice and Bob is $(24\ 75\ A2\ B3\ 34\ 75\ 56\ 88\ 31\ E2\ 12\ 00\ 13\ AA\ 54\ 87)_{16}$.

Table 7.5 Key expansion example

Round	Values of t's	First word in the round	Second word in the round	Third word in the round	Fourth word in the round
—		$w_{00} = 2475A2B3$	$w_{01} = 34755688$	$w_{02} = 31E21200$	$w_{03} = 13AA5487$

Some Notes

Each round key in AES depends on the previous round key. The dependency, however, is **nonlinear** because of SubWord transformation. The addition of the round constants also guarantees that each round key will be different from the previous one.

The two sets of round keys can be created from two cipher keys that are different only in one bit.

Cipher Key 1: 12 45 A2 A1 23 31 A4 A3 B2 CC A_A 34 C2 BB 77 23
Cipher Key 2: 12 45 A2 A1 23 31 A4 A3 B2 CC A_B 34 C2 BB 77 23

Key Comparison

The concept of weak keys, as we discussed for DES in Chapter 6, does not apply to AES. Assume that all bits in the cipher key are 0s. The following shows the words for some rounds:

Table 7.6 Comparing two sets of round keys

R.	Round keys for set 1	Round keys for set 2	B. D.

10	83AD32C8 FD460330 C5547A26 D216F613	E83BDAB0 FDD00348 A0A90064 D2EBF651	52

Pre-round:	00000000	00000000	00000000	00000000
Round 01:	62636363	62636363	62636363	62636363
Round 02:	9B9898C9	F9FBFBAA	9B9898C9	F9FBFBAA
Round 03:	90973450	696CCFFA	F2F45733	0B0FAC99
...
Round 10:	B4EF5BCB	3E92E211	23E951CF	6F8F188E

The words in the pre-round and the first round are all the same. In the second round, the first word matches with the third; the second word matches with the fourth. However, after the second round the pattern disappears; every word is different.

Key Expansion in AES-192 and AES-256

Key-expansion algorithms in the AES-192 and AES-256 versions are very similar to the key expansion algorithm in AES-128, with the following differences:

1. In AES-192, the words are generated in groups of six instead of four.
 - a. The cipher key creates the first six words (w_0 to w_5).
 - b. If $i \bmod 6 \neq 0$, $w_i \leftarrow w_{i-1} + w_{i-6}$; otherwise, $w_i \leftarrow t + w_{i-6}$.
2. In AES-256, the words are generated in groups of eight instead of four.
 - a. The cipher key creates the first eight words (w_0 to w_7).
 - b. If $i \bmod 8 \neq 0$, $w_i \leftarrow w_{i-1} + w_{i-8}$; otherwise, $w_i \leftarrow t + w_{i-8}$.
 - c. If $i \bmod 4 = 0$, but $i \bmod 8 \neq 0$, then $w_i = \text{SubWord}(w_{i-1}) + w_{i-8}$.

Key-Expansion Analysis

The key-expansion mechanism in AES has been designed to provide several features that thwart the cryptanalyst.

4

Ciphers

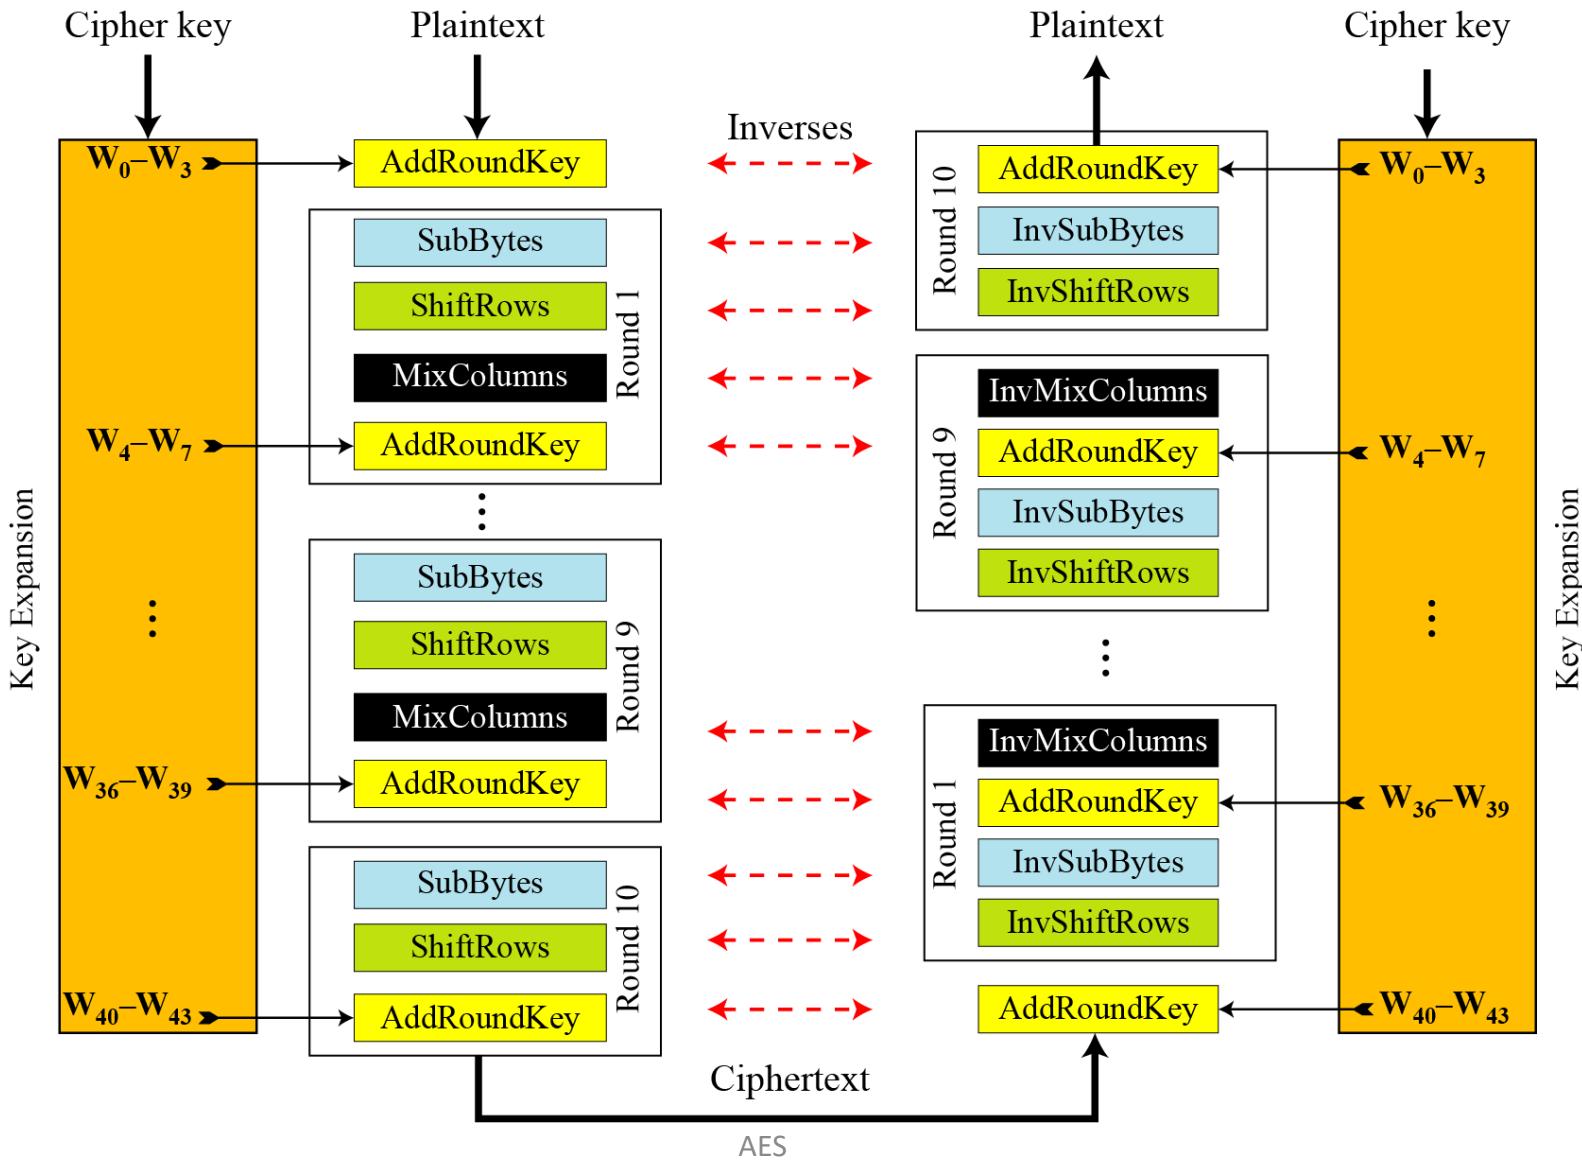

Cipher

AES uses four types of transformations for encryption and decryption. In the standard, the encryption algorithm is referred to as the cipher and the decryption algorithm as the inverse cipher.

Topics discussed in this section:

1. Original Design
2. Alternative Design

Original Design

Algorithm

The code for the AES-128 version of this design is shown in Algorithm 7.6.

Algorithm 7.6 *Pseudocode for cipher in the original design*

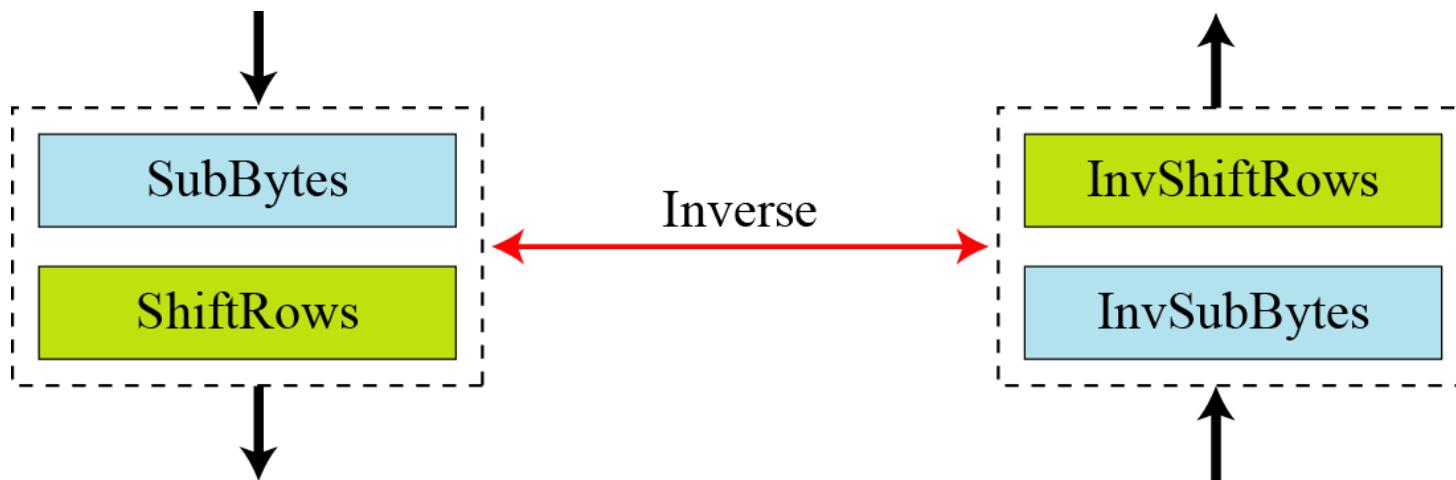

```
Cipher (InBlock [16], OutBlock[16], w[0 ... 43])
{
    BlockToState (InBlock, S)

    S ← AddRoundKey (S, w[0...3])
    for (round = 1 to 10)
    {
        S ← SubBytes (S)
        S ← ShiftRows (S)
        if (round ≠ 10) S ← MixColumns (S)
        S ← AddRoundKey (S, w[4 × round, 4 × round + 3])
    }

    StateToBlock (S, OutBlock);
}
```

Alternative Design

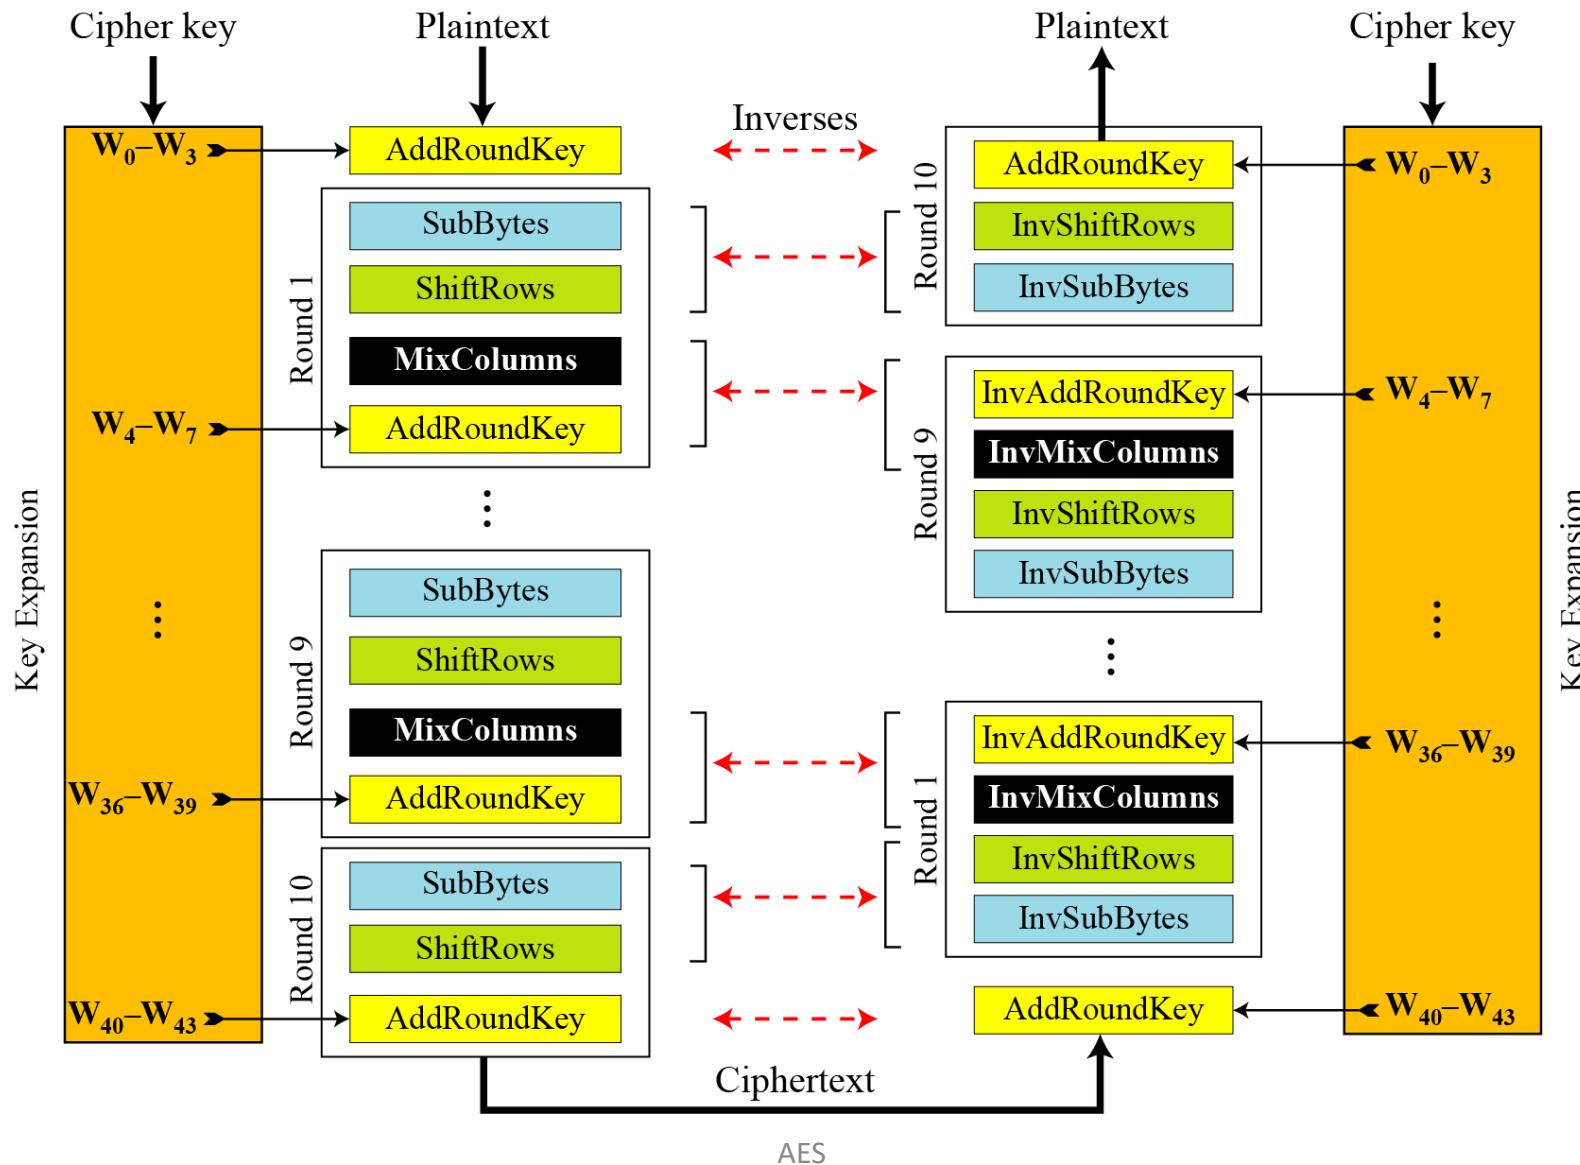

Invertibility of SubBytes and ShiftRows combinations

Invertibility of MixColumns and AddRoundKey combination

Cipher and reverse cipher in alternate design

Changing Key-Expansion Algorithm

Instead of using InvRoundKey transformation in the reverse cipher, the key-expansion algorithm can be changed to create a different set of round keys for the inverse cipher.

5

Examples

Examples

In this section, some examples of encryption/ decryption and key generation are given to emphasize some points discussed in the two previous sections.

The following shows the ciphertext block created from a plaintext block using a randomly selected cipher key.

Plaintext:	00	04	12	14	12	04	12	00	0C	00	13	11	08	23	19	19
Cipher Key:	24	75	A2	B3	34	75	56	88	31	E2	12	00	13	AA	54	87
Ciphertext:	BC	02	8B	D3	E0	E3	B1	95	55	0D	6D	FB	E6	F1	82	41

Example of Encryption

the state entries in one round

Figure 7.21 shows the state entries in one round, round 7, in Example 7.10.

Ciphertext of all 0s

One may be curious to see the result of encryption when the plaintext is made of all 0s. Using the cipher key in Example 7.10 yields the ciphertext.

Plaintext:	00	00	00	00	00	00	00	00	00	00	00	00	00	00	00	00	00	00	00
Cipher Key:	24	75	A2	B3	34	75	56	88	31	E2	12	00	13	AA	54	87			
Ciphertext:	63	2C	D4	5E	5D	56	ED	B5	62	04	01	A0	AA	9C	2D	8D			

Avalanche Effect

Let us check the avalanche effect that we discussed in Chapter 6. Let us change only one bit in the plaintext and compare the results. We changed only one bit in the last byte. The result clearly shows the effect of diffusion and confusion. Changing a single bit in the plaintext has affected many bits in the ciphertext.

Plaintext 1: 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00

Plaintext 2: 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 01

Ciphertext 1: 63 2C D4 5E 5D 56 ED B5 62 04 01 A0 AA 9C 2D 8D

Ciphertext 2: 26 F3 9B BC A1 9C 0F B7 C7 2E 7E 30 63 92 73 13

All Key 0s

The following shows the effect of using a cipher key in which all bits are 0s.

Plaintext:	00	04	12	14	12	04	12	00	0c	00	13	11	08	23	19	19
Cipher Key:	00	00	00	00	00	00	00	00	00	00	00	00	00	00	00	00
Ciphertext:	5A	6F	4B	67	57	B7	A5	D2	C4	30	91	ED	64	9A	42	72

Analysis of AES

ANALYSIS OF AES

This section is a brief review of the three characteristics of AES.

Topics discussed in this section:

1. Security
2. Implementation
3. Simplicity and Cost

Security

AES was designed after DES. Most of the known attacks on DES were already tested on AES.

Brute-Force Attack

AES is definitely more secure than DES due to the larger-size key.

Statistical Attacks

Numerous tests have failed to do statistical analysis of the ciphertext.

Differential and Linear Attacks

There are no differential and linear attacks on AES as yet.

Implementation

AES can be implemented in software, hardware, and firmware. The implementation can use table lookup process or routines that use a well-defined algebraic structure.

Simplicity and Cost

The algorithms used in AES are so simple that they can be easily implemented using cheap processors and a minimum amount of memory.
